

# What's New in GENERATE

Version 2.0.1

1. **Streamlined user interface** - Reduced clicks to setup the topology optimization study. You no longer have to double-click into and out of the various parts to setup the generative study. Instead the user interface has been flattened so that you have easy access to most of the commands at the top level, reducing the number of clicks & the time it takes to setup the study.

2. **Redesigned Control Center** - The Control Center (which shows optimization and simulation progress) has been redesigned to provide individual control over the Optimize Topology and Simulation design steps. Added visual animation effects clearly show the progress during each step.

3. **Bug fixes, stability updates & usability enhancements**
4. **Faster topology optimization computations**
5. **On-demand mesh interval updates** - This option can now be defined under Edit -> Application options, and allows users to define the time interval at which GENERATE will make a request for the result mesh to be updated. Smaller time intervals will result in frequent updates to the result mesh and longer processing times, and vice versa...longer time intervals will result in faster processing times.

Please check out this overview [video](#) of the new enhancements.

We hope you find these updates helpful and it improves your experience with the software. We are always on the lookout for your feedback to make things better, please feel free to share your thoughts/feedback with us by emailing [generate-support@ptc.com](mailto:generate-support@ptc.com).

Cheers,  
The GENERATE Team
